

**DESPLAINES VALLEY MOSQUITO ABATEMENT DISTRICT WEEKLY REPORT
OPERATIONAL UPDATE START OF SEASON THROUGH 9/13/26**

The Desplaines Valley Mosquito Abatement District covers a 77 square mile area in western Cook County. **The District** issues weekly operational reports during the mosquito season to the Illinois Department of Public Health, Cook County Department of Public Health, Local Health Departments, other public health entities including Mosquito Abatement Districts. Reports address operations to date, and provide a summary of quantitative and technical data applicable to **our District**. Please forward this report to any interested parties and contact us to be included in the weekly distribution.

The specifics of our control methodologies including mosquito larval control, source reduction, mosquito/disease surveillance protocol, contingency adult mosquito control, products utilized, application rates, etc. are not included in the weekly reports, however are described in full detail in the yearly Operations Reports available at our website www.dvmad.org.

Mosquito Control Efforts and Pesticide Use Summary

The inspection/treatment of all potential mosquito breeding sources was formally started in April. Sources which are difficult to access are treated with extended-release insect growth regulator pellets to expand inspection/treatment cycle windows. All other sources are inspected/treated as required on a regular cycle.

We are within our fifth round for all extended-release pellet designated sources, and within our ninth inspection/treatment round of all other sources.

We finished curbside stormwater catch basin treatment for the season. During 2026, a variety of larval control products will be utilized in catch basin operations. VectoLex inventory was used up during the first round with a switch to VectoMax. The second round used a combination of one Sumilarv WSP Sachet plus one Natular G30 WSP. The third and final round used VectoMax. Finally, a combination of one Natular G30 WSP plus one Sumilarv WSP are being used in the Brookfield Zoo and miscellaneous high traffic areas.

We finished our final round of off-road stormwater catch basin treatment for the season. VectoMax was used for the first round, with one Sumilarv WSP Sachet plus one Natular G30WSP used in the second round.

A summary of insecticide product usage through September 13, 2026 includes the following:

- 16,060 Natular G30 WSP in on-road catch basins
 - 59 Natular G30 WSP in general larval operations
- 5,668 Natular G30 WSP in off-road catch basins
- 34,783 Sumilarv WSP Sachets in on-road catch basins (3 Sachets/Basin)
 - 114 Sumilarv WSP Sachets in general larval operations
- 5,616 Sumilarv WSP Sachets in off-road catch basins (3 Sachets/Basin)
- 31,047 VectoLex Packets in on-road catch basins
 - 0 VectoLex Packets in off-road catch basins
- 49,604 VectoMax Packets in on-road catch basins
 - 67 VectoMax Packets in general larval operations
- 7,231 VectoMax Packets in off-road catch basins
 - 167 Altosid XR Briquets in general larval operations
- 3,736 lbs of Altosid Pellets in general larval operations
- 12,631 lbs Vectobac-G Granular BTI in general larval operations
 - 5.9 gal Vectobac 12AS Liquid BTI concentrate in general larval operations
 - 21.9 gal BVA-2 Larvicide Oil in general larval operations
- 106.0 gal Duet ULV concentrate for adult control operations
- 20.0 gal Remoa-Tri for adult control operations

Contingency adult control operations were conducted on July 28 & 29 in the following areas: Bedford Park (W of Harlem), Bridgeview (North of 71st), Brookfield, Hodgkins, Lyons, McCook, Riverside (W of First Ave), and Summit

Contingency adult control operations were conducted on August 6 & 7 in the following areas: Bellwood, Berkeley, Hillside (N of Roosevelt), Melrose Park (S of North Ave), Northlake (S of North Ave), Stone Park, and Unincorporated Elmhurst within Cook County

Contingency adult control operations were conducted on August 17 in the following areas: Broadview (S of Cermak), Countryside (N of Plainfield Rd), Hillside (S of Roosevelt Rd), LaGrange, LaGrange Park, Westchester, and Unincorporated Lyons Township (E of Willow Springs Rd & N of 55th)

Contingency adult control operations were conducted on August 19 in the following areas: Broadview (N of Cermak), Countryside (E of LaGrange Rd & N of Plainfield), Hodgkins, LaGrange (E of LaGrange Rd & S of 47th), and Maywood

Contingency adult control operations were conducted on August 26 & 27 in the following areas: Oak Park, River Forest

Contingency adult control operations were conducted on September 8 in the following areas: Burr Ridge (within Cook County, N of I-55), Countryside (N of I-55 & W of Willow Springs Rd), Indian Head Park, and Unincorporated Lyons Township (S of 55th & W of Willow Springs Rd)

Contingency adult control operations were conducted on September 10 in the following areas: Hodgkins

Tires are significant sources of West Nile Virus vector mosquitoes, in addition other invasive mosquitoes capable of transmitting various tropical viruses, such as Zika, Dengue, Chikungunya, Yellow Fever, etc. Tires are accepted from **District** residents, and illegally abandoned "fly-dump" tires found throughout **the District** are collected for disposal. Collection of tires is ongoing with appropriate disposal through the Illinois EPA. A total of 321 tires have been collected to date with 966 tires recycled to date.

Public Education efforts will be continued as the mosquito season progresses. The District had an information booth set up on June 21 at the Village of Lyons Car Show plus participated in the Village of Lyons 4th of July parade, and a booth on August 4 at the Village of Indian Head Park National Night Out event.

A total of 36 resident service requests were received through this period.

Laboratory Collections and Testing Summary

The District's lab monitors the local mosquito population in order to observe species presence, trends in growth and decline, and disease transmission activity. There are over 40 types of mosquito species regularly found in the area capable of transmitting a multitude of viruses and parasites affecting humans and wildlife. For example, dog heartworm is a leading cause of death for wild coyotes, with pet dogs being at great risk. Birds are among the most affected by West Nile Virus, with a steep decline in the local corvid population without a full recovery since the virus has become endemic in the Chicago region.

West Nile Virus (WNV) is very common and detected annually at varying levels. Though WNV can be difficult to diagnose and a vast majority of cases have light symptoms, Illinois has seen thousands of documented cases of WNV resulting in hundreds of lives lost since 2002.

The network of 8 New Jersey Light Traps and of 18 Gravid Traps were placed into service on **April 27** to begin mosquito monitoring. A CO₂ baited BG-Sentinel trap is also in service to monitor the growing invasive **Asian Tiger Mosquito** (*Aedes albopictus*) population, which has become the greatest nuisance species in **the District**.

Gravid traps are highly attractive to egg laying female *Culex spp.* mosquitoes which transmit WNV, and are likely to have taken at least one blood meal (male mosquitoes do not bite and won't transmit the virus). These traps collect daily. Mosquitoes are identified, then pooled into batches of up to 50 to be tested. **A total of 191,716** of these mosquitoes have been collected as of **9/16**.

The week 37 WNV vector mosquito collections decreased to **101.4** mosquitoes per trap/night from the staggering 226.4 the week prior. Although collections are **above average**, there has been a significant decline due to cooling temperatures and slowed breeding activity. A visual comparing 2026 collections to that of previous years is included on the next page.

Using qRT-PCR (Quantitative Real Time Polymerase Chain Reaction), a total of **2,394 *Culex spp. pools*** have been tested through September 16th, with **1,104 WNV positive pools**. Our pools are being tested for the related St. Louis Encephalitis Virus (SLEv) as well, with no positive results to date.

The **Vector Index (VI)** is an approximation of the number of WNV positive mosquitoes collected per trap, per night, using the infection rate relative to the daily average mosquitoes collected. A Vector Index of 1.00 is considered an elevated Risk Threshold. The **VI decreased greatly to 1.93** from 5.86 the week prior (last week's report claimed a lower vector index due to an error, though it was still very high). The VI is still **above average** due to elevated vector activity lingering later into this season. Although infection risk is still there, the positive tests we have been getting are showing lower levels of virus, meaning that virus transmission among positive mosquitoes is far lower than in previous weeks. A visual comparing 2026 Vector Index to that of previous years is included below.

Below is the summary of our weekly WNV PCR Test Results. Please contact mark@dvmad.org for any inquiries regarding this information.

New Jersey Light Traps target many types of nuisance mosquitoes. In this case, mosquitoes active from dusk to dawn and attracted to light. Greater collections are generally due to large broods of floodwater mosquitoes that appear a week or two after heavy region-wide rain events, with a multi-day spike in nuisance activity, quickly dropping, but persisting for another week or two. These traps collect daily and identified to sex and species.

Collections have stayed below average. Nuisance reports are well above average due to daytime activity of *Ae. albopictus* throughout the district, though are decreasing. **As of 9/5**, there have been **17,483 female** and **7,996 male** mosquitoes counted and identified. Due to lighter staff as we get later into the season and high gravid *Culex spp.* collections, light trap data is a little behind, though average counts have not rose. A visual comparing 2026 daily light trap collections to that of previous years, followed by a breakdown of species collected is included on the next page

Current Cumulative Light Trap Mosquito Counts Beginning 4/27/26 Ending 9/3/26

SPECIES	FEMALE	MALE
=====	=====	=====
Aedes albopictus	7	8
Aedes cinereus	2	0
Aedes vexans	15234	5059
Anopheles barberi	3	4
Anopheles punctipennis	110	38
Anopheles quadrimaculatus	22	9
Anopheles walkeri	1	0
Coquilleltidia perturbans	10	1
Culex erraticus	51	25
Culex pipiens	1546	2563
Culex restuans	197	94
Culex tarsalis	1	0
Culex territans	46	81
Culiseta inornata	43	8
Culiseta melanura	1	9
Culiseta morsitans	0	1
Ochlerotatus aloponotum*	1	0
Ochlerotatus canadensis	0	2
Ochlerotatus dorsalis	0	1
Ochlerotatus grossbecki	1	4
Ochlerotatus japonicus	7	5
Ochlerotatus sollicitans	0	1
Ochlerotatus spenceri	0	13
Ochlerotatus sticticus	4	3
Ochlerotatus stimulans	4	10

SPECIES	FEMALE	MALE
=====	=====	=====
Ochlerotatus triseriatus	18	22
Ochlerotatus trivittatus	86	14
Orthopodomyia signifera	3	0
Psorophora ciliata	9	0
Psorophora columbiae	3	0
Psorophora ferox	2	6
Uranotaenia sapphirina	71	15

TOTAL CULEX FEMALE: 1,825
TOTAL FEMALE: 17,333

**New, Uncertain ID*

Due to the establishment of the daytime-active and extremely aggressive **Asian Tiger Mosquito** (*Aedes albopictus*), mosquito annoyance reports have increased during periods of low light trap collections. Traps have caught **135 female in week 36** (versus 380 caught last week), with **a total of 1,947** in 2026. In general, the population steadily increases as the season progresses, peaking in late August with activity continuing until first frost. These mosquitoes reproduce in small amounts of water held in things like neglected containers, tarp folds, clogged gutters, tires, etc. They have a short flight range and stay near the water where they originate, so their presence implies breeding spots are very close. Due to these factors, they are difficult to monitor and control by conventional methods and public outreach important. **The District** coordinates with its villages and local health departments to disseminate information regarding the elimination of standing water and ways to contact us for service requests.

The District has been conducting tick monitoring operations as time and weather permits. It is about the time of year where we would like to begin conducting tick drags, though gravid *Culex spp.* are keeping us busy. Ticks collected are to be transferred to the Illinois Department of Public Health to be tested for pathogens.

For any inquiries, please contact us by email at dvmad@dvmad.org
or by phone at (708)447-1765 during our business hours of 7AM-3:30PM, Monday through Friday.
